

Rethinking Development through the Three Es

Submissions for this panel are now closed.

Development challenges today are increasingly interconnected, making it difficult to pursue economic growth, environmental sustainability and social equity as separate policy objectives. Geopolitical uncertainty, climate change, technological disruption and widening inequalities demand integrated development approaches that recognise the interdependence of the three Es — Economy, Environment and Equity.

This panel will explore how governments, academia, civil society and the private sector can develop coherent policies that balance growth, resilience and inclusion while strengthening governance and institutional capacity. The session seeks to identify practical pathways for embedding the three Es into development planning and policymaking in an era of disruption. Academics, researchers and practitioners are invited to submit original and unpublished research papers and policy papers that contribute theoretical, empirical or policy insights aligned with the panel theme and offer innovative, evidence-based solutions for development.

Key questions to be addressed:

- How can the three Es be better integrated in development?
- What reforms are needed to achieve the three Es?
- Can technology accelerate inclusive and resilient development?
- What can the Global South teach us about rethinking development?

Panel Organisers:

SDC Unit, Sustainable Development Policy Institute, Pakistan
